Hybrid Night Brace

Hybrid Night Brace offers effective scoliosis correction during the night.
The Hybrid Brace applies targeted pressure to achieve a three-dimensional correction of the spine, with a primary focus on derotation. Designed for nighttime use only, it prevents muscle weakening and ensures easier patient adaptation.

Each brace is lightweight, featuring a thin plastic outer shell and a soft inner lining for enhanced comfort. The goal of treatment is to prevent scoliosis from worsening while allowing the patient to maintain muscle strength.

Every brace is custom-made based on precise patient measurements, including circumferential, medial-lateral, and anteroposterior dimensions. These measurements, combined with data from a specialized measurement board, are processed through advanced software to create a mold with built-in curve correction. This mold serves as the foundation for manufacturing a perfectly tailored spinal brace.

Since the Hybrid Night Brace is designed for nighttime use only, it offers an effective yet non-restrictive solution for scoliosis treatment.
